

Tool Making Industry

The increasing demands of the machinery, mold and tool making industry standards rely on high-quality measurement technology to check for surface flaws, compare part-to-CAD and reverse engineering various works of art.

Here at Central Scanning we have a Steinbichler Comet L3D which is ideal for tool and component measuring. When it comes to parts with a great number of features, this method is much faster than measurement using conventional tactile systems.

The Comet L3D sensors contact-free measurement principle, facilitates rapid measurement of objects which are very difficult to measure using CMM machines.

Customers choose us for our high level of precision scanning. The Comet L3D system has a compact design and 3D Data acquisition is exceptionally fast. With an extremely short measurement time and simple to use software, this allows us to take fast and efficient measurements.
